

## Total Herbicide

### Roundup Pro Biactive

Roundup Pro Biactive 360 is a complete product that contains two adjuvants. Alone they offer excellent benefits, but in combination the synergistic effect of these two adjuvant partners ensures an outstanding performance.

The unique Biactive formulation gets more glyphosate into the plant whilst offering the highest levels of performance and safety along with superior long term control of difficult perennial weeds.

**Active Ingredient:**

360g/l Glyphosate

**Application rates:**

5ltrs/ha

Pack size: 5ltrs

### Pistol

Pistol herbicide is a barrier acting non-selective total herbicide for the control of a wide range of annual and perennial broad-leaved weeds and grasses on soft and gravel surfaces in amenity situations.

Pistol herbicide has foliar absorbed translocated activity, combined with soil acting properties, providing pre-emergence weed control.

The product is applied post emergence to control a wide range of annual and perennial broad-leaved weeds and grasses on porous surfaces on land not intended to bear vegetation.

Pistol herbicide has a broad spectrum of activity. It will give initial 'knockdown' and thereafter residual control of a wide variety of broadleaved weeds and narrow-leaved weeds. Some examples of these weeds include Common Daisy, Groundsel, Cranesbill, Dandelion, Forget-me-not, Ragwort, Red-dead-nettle, Rose Bay Willow Herb, Thistles, Speedwell and Annual Meadowgrass. Pistol herbicide controls these weeds for a period of over 6 months.

Pistol herbicide is applied post-emergence of weeds, any time from March until the end of September, provided that the weeds are actively growing. Annual broadleaved weeds should have at least two fully exposed leaves, and annual grasses should be at the one leaf growth stage or beyond. Some perennial weeds, including Docks, Perennial Sow Thistle and Willowherb are best treated just before flowering or the setting of seed.

**Active Ingredient:**

250g/l Glyphosate

40g/l Diflufenican

**Application rates:**

4.5ltrs/ha

Pack size: 5ltrs in 200-260lt/ha

### Festival

Festival herbicide is a liquid formulation pre and post emergence herbicide offering both knockdown and residual control of a wide range of weeds in ornamental trees and shrubs. Since the withdrawal of Dichlobenil based products Festival herbicide is an ideal substitute.

Festival can be used on established trees and shrubs (including roses) without risk of damage so long as the label instructions are followed. Avoid direct contact with foliage when spraying.

Festival herbicide will provide up to 6 months residual control of susceptible weeds from one application.

Festival herbicide is more cost effective than multiple glyphosate treatments.

**Active Ingredient:**

250g/l Oxadiazon

**Application rates:**

4-8ltrs/ha

Pack size: 1ltr
